Optimum Effective Scheduling

Optimum Effective Scheduling (OES) is a concept created to reach the majority of a radio station's listeners 3 or more times by distributing ads evenly throughout a week.

Message retention and recall begins after three exposures. This is referred to as effective reach. The principle behind OES is concentration and repetition. An OES schedule generally consists of 35-60 commercials per week.

Three-Step OES Formula:

1. Calculate turnover ratio for a broad demographic, Mon-Sun 6am-12mid.
   - Turnover ratio is an index of how long a station's audience spends with them and is driven by format.

   How to Calculate:

   Radio Station Cume Audience ÷ Average Quarter-Hour Audience = Turnover Ratio

2. Determine the number of spots per week.

   How to Calculate:

   Turnover Ratio x 3.29 = Spots Per Week

3. Run the spots with even distribution across all days and dayparts, Mon-Sun 6am-12mid.

- OES concentration and repetition
  - The key to OES is concentration and a campaign can be concentrated in the number of weeks, days, dayparts and the number of stations.
    - Weeks – If an advertiser only has a budget for a 12-spot week campaign for the month – put this entire budget into one week of a month for a single 48-spot OES week.
    - Days – concentrate spots in 2 or 3 days. This would be effective for a one-day sale or event.
    - Dayparts – Concentrate spots into a single daypart. If a business is trying to grow their breakfast traffic, concentrating spots in the morning is important.
- Stations – reduce the number of stations being used for the campaign, concentrate spots on one station for the highest return.¹
